REPORT NO

THIS IS UNEVALUATED INFORMATION

1. In connection with the establishment of state reserve storage depots a fuel depot with a storage capacity of nine million liters will be erected at Zernsdorf, about three km east of Koenigswusterhausen, immediately on the railroad line. It is planned to build nine underground double-shell containers each with a capacity of one million liters. The space between the two shells will be filled with water, and thermostats will be installed in order to indicate leaks in the inner shell. Six of the containers are scheduled to store light and heavy gasoline, while the remaining three will be used for Diesel oil. The tanks will be filled and unloaded by means of three pumps and six tapping points located on a railroad siding. Each of the pumps has a capacity of six cubic meters per hour. The pipes will be of porcelain, have a diameter of 300 mm, and be laid in ducts.
2. Construction work for the fuel depot will be executed by the Bau Union Stree. The construction site was installed in mid-September 1953.
